                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Clone CTA-437L15 is from a release of the human BAC library CTB-HS-A. The library contains cloned DNA from human sperm. See: Shizuya et al., Proc. Natl. Acad. Sci. USA 89:8794-7 (1992); U-J. Kim et al., Genomics 34:213-8 (1996). The clone is available from VECTOR: pBeloBAC11
                                                                                                                                                                                                                                                                                          NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                     all regions were double stranded or sequenced with an alternate chemistry; an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The clone sequenced to the left is CTA-237G1. The actual start of this clone is at base position 1 of CTA-437L15; actual end is at 116650 of CTA-437L15.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This chromosome 8 clone was provided by Dr. Patrick Concannon (patcon@vmmc.org) at the Virginia Mason Research Institute.
                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence was finished as follows unless otherwise noted:
                                                                                Center: Washington University Genome Sequencing Center Center code: WUGSC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  note="CpG_island (%GC=69.1, o/e=0.80, #CpGs=93)"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This clone contains STS HS275YF1 (NID:g1051703).

can interact with, intracellular mediators or modulators of inflammation, cell death and/or cell survival pathways, directly or indirectly. Cells can be modulated or mediated in inflammation, cell death or cell survival pathways or another intracellular signalling activity using B1. Conditions such as AIDS and cancer can be treated using B1. Antibodies, oligonucleotides and ribozymes can also be used to regulate the above
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   B1 protein; intracellular mediator; modulator; inflammation; cell deatn; cell survival pathway; intracellular signalling; AIDS; cancer; human; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      protein which

                                                                                                                                                                                                                                                                                                                                                                                                                                                                  human phosphorylation effectors useful for the diagnosis, treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           46138-246168 encode human phosphorylation effectors (PHSP), designated PHSP1-PHSP31 (the protein sequence for PHSP28 is not given in the specification). The sequences were isolated from cDNA libraries prepared from various human tissues. The PHSP proteins are useful for the diagnosis, treatment and prevention of proliferative disorders, immune disorders and neuronal disorders. The PHSP proteins form pharmaceutical compositions which useful for treating or preventing disorders associated with decreased PHSP expression/activity. PHSP antagonists are useful for treating or preventing disorders associated
                                                                                                                                                                                                                                                                                                                              Baughn MR;

C77607 to C78448 encode the human cancer associated proteins given in and calls the genes are expressed in. Example of activities include: cytostatic; proliferative; vulnerary; immunomodulator; antidiabetic; antidiasthmatic; antidiabetic; antidiasthmatic; antidiabetic; antidiasthmatic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidialeratic; antidiantic; antidiammatory; conditions; antidiabetic; antidialeratic; antidiadetic; antidialeratic; antidiadetic; antidiadetic; antidiadetic; conditions; and antidiadetic; conditions and diagnosing pathological conditions. Polynucleotides and conditions and diagnosing pathological conditions. Polynucleotides, antibodies, agonists and antagonists from the present immune disorders by activating or invention may be used for treat immune disorders by activating or inhibiting the proliferation, differentiation or mobilisation of immune calls; to treat disorders of haematopoietic cells, autoimmune disorders, allergic reactions, graft versus host disease and organ rejection, cancers, cardiovascular disorders, neurological disease and bacterial or viral infections. The peptides, nucleotides, antibodies, agonists and antagonists may be also be used in the exemplification of the present
Novel isolated nucleic acids comprising sequences encoding peptides useful for treating or diagnosing e.g. cancer \,

This invention describes the isolation of nover numan caspase.

This invention describes the isolation of nover numan caspase.

The invention are involved in the regulation of caspase activation.

The invention are involved in the regulation of caspase activation.

The caspase recruitment domain (CARD) polynucleotides, polypeptides, homologues and antibodies can be used in screening assays, detection assays, predictive medicine and therapeutic and prophylactic methods of treatment. The methods may be used to diagnose and treat patients which are suffering from a disorder associated with abnormal level or rate of are suffering from a disorder associated with abnormal level or rate of are suffering from a disorder associated with abnormal level or rate of activity of a caspase. Diseases that may be treated include cancer complex, abnormal activity of the TWF receptor complex, or abnormal activity of the TWF receptor complex.

Complex, abnormal activity of the TWF receptor complex, or abnormal activity of the TWF receptor complex, or abnormal activity of the TWF receptor complex.

Complex, abnormal activity of the TWF receptor complex, or abnormal activity of the TWF receptor complex, or abnormal activity of the TWF receptor complex.

Complex, abnormal activity of the TWF receptor complex (e.g. farticiallary follacular lymphoma, carcinomas associated with mutations of infections, Alzheimer's disease, parkinson's disease, amyotrophic lateral sclinfections, Alzheimer's disease, Parkinson's disease, amyotrophic lateral sclenosis, rethinitis pigmentosa, spinal muscular dystrophy, cerebellar degeneration, anaemia, myelodysplastic syndrome, myocardial infarction, and such scline such of cellular proliferation and differentiation and cell survival. The CARD proteins may also be used to for regulation of cellular proliferation and differentiation and cell survival. The CARD proteins may also be used to for screen drugs compounds which modulate their activity. The CARD-4 gene can express a long transcript that encodes CARD
                                                                                                                                                                                Novel CARD-3 and CARD-4 genes and polypeptides used or treating regulation of cellular proliferation and differentiation and cell
                                                                                                                                                                                                                                                                                                               Example 2; Fig 1; 181pp; English

This sequence encodes the number with fire interacting the invention. The RICK protein acts as a positive requiator of apoptosis, potentiating apoptosis induced by caspase-8 and caspase-10 caring CDPS signalling pathway inhibitors and activators, and methods and apoptosis signalling pathway inhibitors and activators, and methods and compositions for screening compounds which will modulate the interactions of the various compositions identified: ARC, RICK, and the CIDE family of activators (CIDE-A, CIDE-B and DREP-1). RICK, in the interactions of disease associated with excess cell growth and dysrequiation of apoptosis. Complexes containing RICK and CLARP can be used in drug creening assays to identify inhibitor molecules blocking CD95-mediated apoptosis. Overspression of ARC in an in vitro cell system can be used to identify inhibitors of the enzymatic activity of caspase-8.

Clentification of ARC-11ke inhibitory compounds may be useful for gene therapy treatment of disease with increased cell death in muscle tissue and cardiac disorders. Therapeutic compositions of CIDEs can be used to treat e.g. cancer, AIDS, neurodegenerative disorders, aplastic anaemia, can be used as reagents for the preparation or affinity chromatography complexed and confidentially measuring RICK levels. A specific inhibitor of an essential step in the biochemistry of apoptosis is needed. RICK interaction with intracellular factors such ass CLARP and FADD appears to be essential for apoptosis, inhibitors of RICK binding to intracellular grows appropriate and capital drug candidates.
                                                                                           sequence encodes the human RICK (RIP-like interacting CLARP kinase)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         84 IleCysAsnGluProGluPheLeuGlyIleValThrGluTyrMetProAs 100

Dreast and ovarian cancer associated DNA, protein, agonist or antagonist sequences exhibit cytostatic; immunosuppressive; nootropic; neuroprotective; antiviral; antialergic; hepatotropic; antidiabetic; antifinfammatory; antiviral; anticonvulsant; antibacterial; antifinfammatory; antioner; valuerary; anticonvulsant; antibacterial; antifungal; antiparasitic and cardiant activity. The polynocleotide and protein sequences are used in the diagnosis of cancer, particularly breast and ovarian cancer. The nucleic acid sequences, proteins, agonists and agonists may also be used in the diagnosis, prevention and treatment of immune disorders e.g. Addison's disease, allergies, autoimmune hamolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crobn's cardiovascular disorders such as myocardial ischemmias; wound healing; neurological diseases such as cerebral anoxia and epilepsy; and
Sequences F21614 - F22031 represent DNA sequences encoding human proteins
                          B58711 - B59128. The DNA and protein sequences are associated with breast and ovarian cancer. Included in the invention are sequences F22032 - F22040 and B59129 which are used in the isolation and characterisation of the DNA and protein sequences of the invention. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                infectious diseases.

The present sequence encodes a murine death associated kinase protein, containing ankyrin repeats, designated DAKAR. The DAKAR polynuclectides can be used to express the polypeptides, and as probes to identify nucleic acids encoding proteins having kinase activity. DAKAR polypeptides and fragmented polypeptides are used for purifying proteins, e.g. to measure protein activity; as quality assurance agents to monitor shelf life and stability of binding partner proteins; as research agents, e.g. in assays to determine protein kinase activity, to identify novel molecules involved in signal transduction pathways, and to identify therapeutic compounds which may interfere with apoptosis; as molecular weight and isoelectric focusing markers; as controls for peptide fragmentation; identification of unknown proteins, e.g. by comparison with proteins in databases; and for preparation of antibodies. The antibodies can be used in assays to detect the presence of the protein, and to purify the protein by immunoaffinity chromatography. The antibodies can also be used to block binding of the DAMAR polypeptides to their binding partners. Compounds that inhibit the protein are negligible to the DAMAR can be used to the Leat diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (DAKAR) used

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    267
                                                                                                                                                                                                                                                                                                                                        123
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 157
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 dermal papilla, human keratinocytes and neonatal foreskin fibroblasts, and mouse embryonic skin, keratinocyte stem cells and transit amplifying cells. Polypeptides of the invention may be used to treat inflammation, cancer and neurological diseases. The proteins may be used to stimulate the growth and motility of keratinocytes, to inhibit the growth of cancer cells, to modulate angiogenesis and tumour vascularisation, to modulate skin inflammation, to modulate spithelial cell growth and to inhibit binding of HIV-1 to leukocytes. The invention may also be used to treat growth and developmental defects, skin wounds and hair follicle disorders. Sequences Z61606-Z61832 represent cDNA sequences derived from z61725-Z61765, Z61802-Z61811 and Z61826 encode proteins with an N-terminal signal sequence, indicating that the proteins are secreted. Sequences Z61650-Z61668, Z61810, Z61812-Z61817 and Z61827-Z61829
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                to novel nucleic acid sequences derived from rat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Murison JG;

```
The present polynucleotide encodes a polypeptide which is expressed in mammalian skin cells. The polypeptide is useful for stimulating keratinocyte growth and motility, inhibiting the growth of cancer cells, modulating angiogenesis, inhibiting angiogenesis and vascularisation of tumours, modulating skin inflammation, stimulating the growth of epithelial cells, inhibiting the binding of human immunodeficiency virus (HIV)-1 to leukocytes, and treating inflammatory disease, cancer and neurological diseases. The polynucleotide can be used as a marker, in the identification of genetic disorders, and for the design of oligonucleotides for examining expression patterns.
                                                       New isolated polynucleotide used in the identification of genetic disorders and encoding polypeptides used for treating inflammatory disease, cancer and neurological diseases .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 123 gileLeuHisGluIleAlaLeuGlyValAsnTyrLeuHisAsnMetThrP 140

The invention relates to novel nucleic acid sequences derived from rat dermal papilla, human keratinocytes and neonatal foreskin fibroblasts, and mouse embryonic skin, keratinocyte stem cells and transit amplifying cells. Polypeptides of the invention may be used to treat inflammation, cancer and neurological diseases. The proteins may be used to stimulate the growth and motility of keratinocytes, to inhibit the growth of cancer cells, to modulate angiogenesis and tumour vascularisation, to modulate skin inflammation, to modulate epithelial cell growth and to inhibit binding of HIV-1 to leukocytes. The invention may also be used to treat growth and developmental defects, skin wounds and hair follicle disorders. Sequences 261606-261832 represent cDNA sequences derived from several mouse, rat or human skin cell types. Sequences 261606-261891 and 261826 encode proteins with an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Murison JG;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present polynucleotide encodes a polypeptide which is expressed in mammalian skin cells. The polypeptide is useful for stimulating keratinocyte growth and motility, inhibiting the growth of cancer cells, modulating angiogenesis, inhibiting angiogenesis and vascularisation of tumours, modulating skin inflammation, stimulating the growth of epithelial cells, inhibiting the binding of human immunodeficiency virus (HIV)-1 to leukocytes, and treating inflammatory disease, cancer and neurological diseases. The polynucleotide can be used as a marker, in the identification of genetic disorders, and for the design of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                g

The present sequence is that of Genesis clone 971025TRAM004820HT

(Fel) DNA. The translation of the clone (frame 3) is provided in

(T79154. The prolypeptide has kinase activity. The invention
relates to purified murine polypeptides (see Y79152-56) that
have kinase function and isolated nucleic acids encoding them (see
CN 25882-86). The nucleic acids can be used to express the
polypeptides, as probes to identify nucleic acids encoding proteins
polypeptides, as probes to identify nucleic acids encoding proteins
having kinase activity, and in assays to identify chromosomes; map
nucleic acids and bott unmours. Vectors comprising the novel
nucleic acids and host cells (bacterial, yeast, plant, insect or
animal) transfected or transduced with the vectors are claimed.
The kinase polypeptides and their fragments are used as mol.wt. and
isoelectric focusing markers, and as controls for peptide
fragmentation. They also have a number of therapeutic uses, as
kinases play a central role in cellular signal transduction.
                                                                                                                                                                                                                                                         Novel murine polynucleotides encoding kinase polypeptides, used a probes to identify nucleic acids encoding proteins having kinase activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      euHisArgLysThrGluTyrProAspValAlaTrpProLeuArgPheArg 123

PT Novel polynucleotides PT including wounds and o	otides useful for the treatment of various conditions and cancer -
PS Claim 1; Page 85-86; XX	5-86; 235pp; English.
CC The invention relates	slates to novel nucleic acid sequences derived from rat

```
and mouse embryonic skin, kerathocyte stem cells and transit amplifying cells. Polypeptides of the invention may be used to treat inflammation, cancer and neurological diseases. The proteins may be used to stimulate the growth and motility of kerathocytes, to inhibit the growth of cancer cells, to modulate angiogenesis and tumour vascularisation, to modulate epithelial cell growth and to inhibit binding of HIV-1 to leukocytes. The invention may also be used to treat growth and developmental defects, skin wounds and hair follicle disorders. Sequences 261605-261812 represent cDNA sequences derived from several mouse, rat or human skin cell types. Sequences 261606-261849, 261725-261765, 261802-261811 and 261826 encode proteins with an N-terminal signal sequence, indicating that the proteins are secreted. Sequences 261650-261668, 261766-261780, 261812-261817 and 261812-261819 encode proteins with one or more putative transmembrane domains.
neonatal foreskin fibroblasts
                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 1888 BP; 433 A; 518 C; 554 G; 380 T; 3 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present polynucleotide encodes a polypeptide which is expressed in mammalian skin cells. The polypeptide is useful for stimulating keratinocyte growth and motility, inhibiting the growth of cancer cells, modulating angiogenesis, inhibiting angiogenesis and vascularisation of tumours, modulating skin inflammation, stimulating the growth of epithelial cells, inhibiting the binding of human immunodeficiency virus (HIV)-1 to leukocytes, and treating inflammatory disease, cancer and neurological diseases. The polynucleotide can be used as a marker, in the identification of genetic disorders, and for the design of oligonucleotides for examining expression patterns.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Murison JG;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated polynucleotide used in the identification of genetic disorders and encoding polypeptides used for treating inflammatory disease, cancer and neurological diseases -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Mouse; skin cell; cytostatic; antiinflammatory; anti-HIV; mootropic; neuroprotective; vulnerary; immunomodulatory; vaccine; keratinocyte growth stimulation; cancer; angiogenesis inhibition; inflammation; neurological disease; ss.

RIP overexpression leads to cell death. The RIP cDNA was identified from a mouse thymus cDNA library by screening with the human RIP coding sequence (see also T43753) and sequence analysis of overlapping clones. It can be used as a probe and to produce recombinant RIP in host cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                         Receptor interacting protein having death and kinase domain to control diseases that involve abnormal apoptosis, and for diagnosis and drug screening

/note="Organ: prostate; Vector: pT73D-Pac (Pharmacia)
with a modified polylinker: plasmid DNA from the
normalized library NI_CGAP_PT22 was prepared, and ss
circles were made in vitro. Following HAP purification,
this DNA was used as tracer in a subtractive hybridization
reaction. The driver was PCR-amplified cDNAs from a pool
of 5,000 clones made from the same library (cloneIDs
SUBSGOB-986759, 1101192-1101959, and 1217928-1220615).

Sequence 257, Application US/09188930A

Patent No. 6150502

GENERAL INFORMATION:
APPLICANT: Watson, James D.
APPLICANT: Strachan, Lorna
APPLICANT: Strachan, Matthew
APPLICANT: Orrust, Rene
APPLICANT: Orrust, Rene
APPLICANT: Orrust, Rene
TITLE OF INVENTION: Compositions Isolated From Skin Cells
TITLE OF INVENTION: and Methods For Their Use
FILE REPERENCE: 11000.1011c1
CURRENT APPLICATION NUMBER: US/09/188,930A

CURRENT FILING DATE: 1988-11-09
                              1313
